

Abstract

Diploma Thesis - Stimulation of person with physical and multiple disabilities through Vojta's therapeutic concept - is about application of Vojta's reflex locomotion method at newborns and infants. The theoretical assessment is describing the development, basic principles and the use of this method. Vojta's special diagnosing will be also addressed. The next major chapter will be the description of muscular dystrophy and consisting of basic division, description of diagnosing principals and treatment. One chapter is dedicated to Girdle Muscular Dystrophy and its manifestation and difficulties with the diagnosis. Empirical data is being collected through a questionnaire which was given to parents with newborns and infants and will provide a complex vision analysis on Vojta's method and its application to newborn and infants born with physical and multiple disabilities.
